

Business Problem

Streaming platforms compete heavily on user engagement, subscription conversion, and personalization. With hundreds of millions of songs available, the challenge isn't just getting users onto the platform — it's keeping them there, getting them to return daily, and moving them from free plans to paid subscriptions.

This project analyzes music streaming behavior to understand what drives user engagement and what a streaming business owner would want to know about their customers. Using data on listening time, songs played per day, subscription type, favorite genres, moods, and platform usage, I examined how different listener groups interact with the service. The goal of the analysis was to identify which customer segments are the most valuable, which features or habits are linked to higher engagement, and how the business could use this information to improve user retention, personalize recommendations, and strengthen subscription growth. Overall, this project shows how data can turn everyday listening habits into meaningful business insights that support better decision-making.

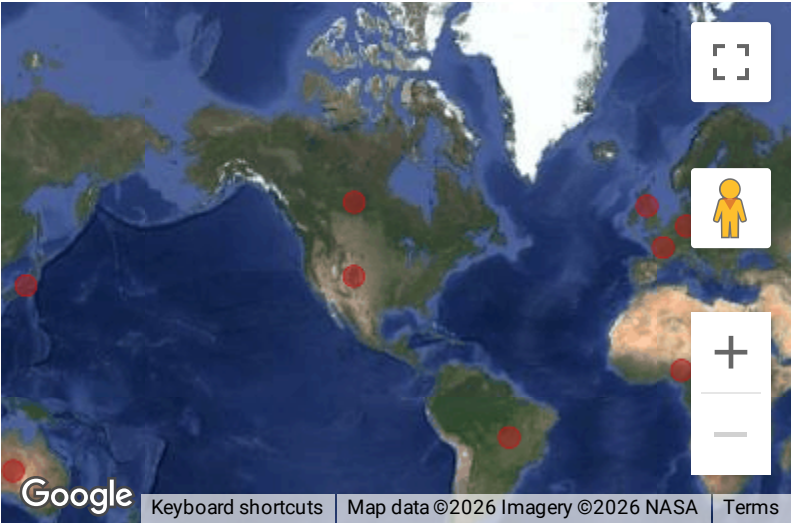

Country Users & Listening Time

	country	Record Count ▾	Max Listening Minutes	Minimum Listening Minutes
1.	USA	61	380	9
2.	Canada	61	481	17
3.	India	50	337	26
4.	Australia	49	293	7
5.	Japan	48	360	17
6.	Germany	48	374	16
7.	UK	48	535	18
8.	Brazil	47	323	6
